

In this Photo Montage project, I tried combining Photoshop and Illustrator for the first time, which was a completely new creative experience for me. By bringing together different visual elements from various sources, I learned how to rebuild a narrative and create new meaning in one image. Elements that were originally unrelated could be unified through adjustments of light, proportion, and color, forming a consistent visual style. This process helped me understand the idea of “re-creation” in digital art.

During the production process, cutting out images, combining them, and unifying the overall tone were the biggest challenges I faced. Since the materials came from many different sources, each image had noticeable differences in lighting, color, and texture, which made them look disconnected at first. To make these elements blend naturally into one composition, I spent a lot of time in Photoshop doing detailed compositing and color correction. By adjusting brightness, saturation, and contrast, I was able to make the lighting more consistent across the image. I also used layer masks and gradient effects to create smooth transitions, which helped add more depth and realism to the final work. In addition, I used Illustrator to draw some detailed elements, such as seagulls and ink effects, which made the image look more vivid and dynamic.

Through this project, I realized how the combination of Photoshop and Illustrator can greatly expand creative possibilities. It allowed me to strengthen both the technical and expressive sides of my work and find a better balance between precision and artistic freedom.
